6. Surgical Support Supplies	1	$4
7. Medical Gloves and Accessories	1	$1.4
8. Injection, Aspiration Needles and Accessories	7	$62.8

The physician. The procedure. The department. And all the details of all the products and people needed. That's a lot to put on one plate, especially if it's constantly changing. And if, like most hospital organizations, it's all on Excel spreadsheets, multiple systems or even index cards, it's enough to give you severe indigestion.

Even organizations with sophisticated EMR and EHR systems don't update their preference cards regularly or provide access to everyone who could benefit from them. Systems don't integrate in real time with item masters, and when a physician moves to another hospital everything has to be recreated even though the same products are being used for the same procedures.

All this can result in:
- Inaccurate preference cards
- Wrong products for procedures
- Wrong stocks
- Significant product waste in the OR
- Inability to properly analyze spend
- Inability on the part of supply chain managers to negotiate better pricing and contracts with suppliers.

That's why you should add SupplyCopia's preference card management software to the menu.

When it comes to giving doctors what they need, nurses have a lot on their plate.

Nurses have to do their best to make sure what the customer, uh, doctor, orders is what ends up on the table.

SupplyCopia's preference card management software helps streamline the whole process of making sure what the doctor orders, is what the doctor gets – on time and on, or under, budget – by plugging the gap between supply chain and clinical teams.

SupplyCopia's preference card management software delivers, even when a physician moves.

When a doctor relocates, his or her preferences can follow. Instantly, easily, and without creating new cards or spreadsheets.

Among other advantages, with this software:

- You can easily import existing preference cards from Excel sheets or other systems
- Preference cards can be edited electronically, saved, printed and sent for approval
- The cost of the product and hence the procedure, is easily known because of integration with the item master
- Easy comparison of products, cost by physician and by procedure
- Physician preference items can be electronically tagged, measured & analyzed
- Nurses can be associated with all the physicians with whom they work
- Products can be selected from the item master
- Functionally equivalent products can be identified and replaced as appropriate
- Total cost of the procedure can be calculated
- Product images and specs can be viewed
